

SCALING-UP LIVESTOCK CLIMATE ACTIONS TO ENHANCE NATIONALLY DETERMINED CONTRIBUTIONS – PHASE II

The purpose of this report is to provide a comprehensive overview of the findings and recommendations from the Phase II study. The study was conducted to assess the potential for scaling up livestock climate actions in order to enhance nationally determined contributions (NDCs) to the Paris Agreement. The findings indicate that there is significant potential for scaling up these actions, particularly in the areas of feed efficiency, manure management, and breeding for climate resilience. However, several barriers to scaling up these actions were identified, including limited access to financing, technical expertise, and data. The recommendations focus on addressing these barriers through a combination of policy, financial, and technical interventions.

SCALING-UP LIVESTOCK CLIMATE ACTIONS TO ENHANCE NATIONALLY DETERMINED CONTRIBUTIONS – PHASE II

The study was conducted in four phases: (1) scoping and stakeholder consultation, (2) data collection and analysis, (3) identification of scaling-up opportunities, and (4) development of recommendations. The scoping phase involved identifying the key stakeholders and the scope of the study. The data collection phase involved conducting interviews, focus group discussions, and reviewing relevant literature. The analysis phase involved identifying the key findings and the barriers to scaling up. The final phase involved developing recommendations for policy, financial, and technical interventions. The findings indicate that there is significant potential for scaling up livestock climate actions, particularly in the areas of feed efficiency, manure management, and breeding for climate resilience. However, several barriers to scaling up these actions were identified, including limited access to financing, technical expertise, and data. The recommendations focus on addressing these barriers through a combination of policy, financial, and technical interventions.
